

#### ASSIGNMENT 4

##### ANS 1

A mode dial or camera dial is a dial used on digital cameras to change the camera's mode. Most digital cameras, including dSLR and SLR-like cameras, support modes, selectable either by a rotary dial or from a menu. On point-and-shoot cameras which support modes a range of scene types is offered.

##### ANS 2

###### PORTRAIT MODE

Portrait mode will “think” that there is a subject in the foreground of the frame and choose a shallow depth of field to keep the human subject in focus but the background blurred. If the camera reads the scene as dark, it will add fill-in flash.

###### Landscape mode

In photography and digital photography, landscape mode is a function of the digital camera that is used when you are taking photos of a scene, not a single object.

###### Action mode

Action or sports modes increase ISO and use a faster shutter speed to capture the action.

###### Macro mode

Macro mode is extreme close-up photography, usually of very small subjects and living organisms like insects, in which the size of the subject in the photograph is greater than life size

##### ANS 3

###### Landscape mode

## PORTRAIT MODE
